

## Test During Development

- Code should achieve at least 90% code coverage with test cases, with exception gui code which is difficult to unit test.
- Write tests and code on a modular basis. No new methods should be added until the old are tested, preferably writing the unit test before coding is done. However, order does not strictly matter as long as code is tested before it is committed.
- Comments! Try to comment the purpose and why for each test method and method written.
